

Situation 1: Syncing District expects MDE to use the district & site numbers specified in the Ed-Fi API records

Situation 2: Syncing District expects MDE to use the district & site numbers specified in Student Education Organization Responsibility Association

NOTES

1. The reporting district and site are the districtNumber, districtType, and schoolNumber loaded to MARSSWES.
2. Ed-Fi API Security requires records to ALWAYS refer to the syncing district. The syncing district must specify their district number, district type, and site number even if they aren't serving that student.
3. The proposed design requires an MDE extension to Student Education Organization Responsibility Association (SEORA) to add the property **ReportingEducationOrganization** (to capture district & site info).
4. The BeginDate and EndDate on the SEORA must match the BeginDate and EndDate on the StudentSchoolAssociation.
5. Multiple StudentSchoolAssociation records means multiple SEORA records if relevant.
6. Because EDVP operates directly on the Ed-Fi ODS, EDVP will show the syncing district, not the reporting district which is substituted by the SiPipeline. However, the MARSSWES local edit reports and the Ed-Fi/MARSS Comparison report would both show the reporting district. This follows the original purpose of EDVP to monitor the data submission process.
7. The SEORA record should be created either by the joint powers district or a member district, depending on the current process and desired result.
